Applied AI Architect Presentation

Anthropic Virtual Onsite Interview

Overview

This interview evaluates your ability to communicate technical concepts, demonstrate product capabilities, and navigate complex dynamics with executive stakeholders. You will lead a 40-minute mock customer meeting. Our goal is to understand how you prepare for and run a real customer meeting - this is your opportunity to show us your approach!

Scenario

FinTechCo is a modern financial services company operating digital payment services and traditional banking divisions. They're evaluating Anthropic's Claude Code alongside other AI coding assistants- but they don't use any agentic coding tools today.

The CTO has invited you to present to their executive team. They want to understand:

- How Claude Code works at a high level
- Why FinTechCo would benefit from it
- How they should evaluate and roll it out

About FinTechCo

- **Infrastructure:** AWS and GCP, serving customers across the United States
- **Priorities:** Team productivity and shipping new products (cost-conscious but not cost-driven)
- **Goal:** Roll out a single agentic coding tool company-wide within the next few months

Technical Teams

Team	Size	Focus	Tech Stack
Software Engineers	120	Digital payments, mobile apps, banking infrastructure	Python, TypeScript, Java
Data Scientists	40	ML models for fraud detection, credit scoring, customer behavior	Python, Jupyter, pandas, scikit-learn, TensorFlow
SREs (Site Reliability Engineers)	20	Managing incidents and keeping systems up and running.	Python, shell scripts, Go

Your Task

Prepare to lead a **40-minute meeting** with FinTechCo, which includes:

- **Overview of Claude Code** via slides:
  - Unique value proposition, competitive differentiators
  - How Claude Code addresses FinTechCo's diverse technical teams
  - Metrics/framework for measuring impact and ROI
  - Recommended evaluation plan with specific use cases to start
- **Live Demo**: A prepared technical demonstration that connects to FinTechCo's use cases. We've included potential example topics below along with an API key with free credits for Claude Code.
- **Wrap up:** Close out the meeting and propose clear next steps before ending the presentation, making sure not to run long.

Attendees

You will be meeting with key stakeholders including:

- **Chief Technology Officer**
    - Veteran technology leader with 20+ years in financial services IT, highly security-conscious, and concerned about regulatory compliance. Has technical depth but is skeptical of new technologies without proven enterprise adoption.
- **Head of Digital Transformation**
    - Forward-thinking technical leader championing AI initiatives within the bank. Dotted line leader of the engineering organization who has been advocating for more modern tools to improve developer productivity.

Key Considerations

- The audience has different levels of technical expertise.
- They are particularly concerned about how to measure business impact.
- They want to understand implementation complexity and timelines.
- ROI and business value must be clearly articulated.

Logistics

- The interview will be scheduled for **50 minutes total**. This includes 5 minutes at the start for introductions (before the role play), 5 minutes at the end for questions you have about Anthropic, and 40 minutes for the mock presentation. If you are running short on time, please recognize that and adapt as necessary so you can leave time to wrap up your presentation.
- Please test that you can share your screen on Google Meet.

Resources

- You have some old slides from past meetings below. Use these are a starting point only, successful presentations typically involve adding/editing/deleting to make your own.
- [MAKE A COPY] Applied AI Architect Interview Slide Deck - Claude Cod...
- Claude Code Doc
- Claude Code Overview

- Video of Boris Cherny (creator of Claude Code) discussing the future of agentic coding
- Webinar on Claude Code (you'll need to register)

API key for Claude Code

Please note that the Recruiting Coordinator will be sending $25 in API credits in your onsite confirmation email. No action needed on your end.

To install Claude Code, run this command:

```
None
curl -fsSL https://claude.ai/install.sh | bash
```

Potential demos topics

- **Common workflows**, including understanding new codebases, fixing bugs, adding features, and refactoring code.
- **Example public finance data:** you can create a free account to access Federal Reserve Economic Data (FRED) for inflation, unemployment, and other datasets. After creating an account and getting an API key, you could set up demos based on this public data on some of the ideas below. Note that trying to combine all of these ideas into a single 10-15 minute demo could be challenging.
    - **Data acquisition**. Highlight how Claude Code can help with data acquisition and review data source information, search the web, etc. *Example motivation: "Your team needs to quickly analyze how Federal Reserve policy changes might impact portfolio strategies for an urgent client presentation."*
    - **Data cleaning and exploratory analysis**. Claude Code transforms significant manual data wrangling into minutes of guided analysis. *Example motivation: "Demonstrate the 'flattening of the Phillips Curve' (diminished correlation between inflation and unemployment)."*

- **Analysis and modeling**. Claude Code enables rapid model prototyping without extensive boilerplate code, allowing quants to focus on insights rather than implementation. *Example question: "How do Federal Reserve policy changes historically impact market volatility, and can we quantify these relationships?"*
- **Dashboarding and visualizations**. Claude Code can rapidly create sophisticated, client-ready interactive applications that would often require significant time or support from someone with front-end dev skills.
